I think learning styles have a major effect on how we take in and store information. I remember hearing somewhere that most people are tactile learners, meaning that they learn better through personal experience more than just hearing it told to them. In most cases I am definitely a tactile learner, but there are instances where I feel the subject matter is best taught in a different way. One of my favorite books for example, Project Hail Mary, has a *lot* of science and that the book needs to explain in order for a lot of plot to make sense. Even though you are only being described what's happening it is still easy to understand since you are seeing the direct consequences of it happen in the book.
