The primary difference between a GUI and a CLI is how you interact with it. A GUI is like your settings tab on your phone or computer. It's all fairly self explanatory and it's designed to be more user friendly, using visual aids and tabs to organize commands. The CLI however, allows you to directly access or run any program or file by typing it into the command line. This might not be as easy to use but it is foundational in programming and it allows you to alter your computer at a base level.
